Got you 👍 — here are the **clean simple steps**, entering Jenkins container **as root**.

☑ Step-by-step (enter container as root + install Terraform)

🔵 1️⃣ Find Jenkins container name

On EC2 host run:

```
docker ps
```

Look for container name like:

```
jenkins
```

🔵 2️⃣ Enter Jenkins container as root

Run:

```
docker exec -u 0 -it jenkins bash
```

👉 `-u 0` = root user.

🔵 3️⃣ Install Terraform inside container

Inside container run:

```
yum install -y unzip
curl -LO https://releases.hashicorp.com/terraform/1.6.6/terraform_1.6.6_linux_amd64.zip
```

```
unzip terraform_1.6.6_linux_amd64.zip
mv terraform /usr/local/bin/
```

Check:

```
terraform -version
```

🟢 4️⃣ Exit container

```
exit
```

Terraform is now available for Jenkins jobs 👍

🟢 5️⃣ Jenkins pipeline stages (recap)

Your Jenkinsfile should run:

```
sh 'terraform init'
sh 'terraform apply -auto-approve'
```

🧠 Simple understanding

EC2 host ≠ Jenkins container

Jenkins runs builds inside container → tools must exist there.

✅ **Interview one-liner:**

“To use Terraform in Docker-based Jenkins, enter the container as root using docker exec and install Terraform inside the container environment.”
