Your error says:

```
Failed to import the required Python library (botocore and boto3)
```

Meaning:

```
Ansible needs AWS Python libraries but they are not installed.
```

Fix

Install the required packages on the Ansible machine.

Run:

```
pip3 install boto3 botocore
```

If pip is missing:

```
sudo dnf install python3-pip -y
```

Then install again:

```
pip3 install boto3 botocore
```

Verify

Run:

```
pip3 list | grep boto
```

You should see:

```
boto3
botocore
```

Then run playbook again

```
ansible-playbook ec2.yml
```

Why this is needed

Ansible uses **boto3 to talk to AWS APIs**.

Flow:

```
Ansible
   ↓
boto3 library
   ↓
AWS API
   ↓
EC2 created
```

✅ **Interview one-liner:**

`boto3` is the AWS SDK for Python used by Ansible modules to interact with AWS services.

Also attach a role with ec2 full access to the instance.
